About IBM Content Manager OnDemand for iSeries Common Server Indexing Reference (SC27–1160)

This book contains information about indexing methods, preparing index data, and using tools to index reports that you plan to store in and retrieve from IBM Content Manager OnDemand for iSeries Common Server Version 5 Release 2 (OnDemand).

Who should read this book

This book is of primary interest to administrators and other people in an organization who are responsible for preparing data to be stored in OnDemand.

How this book is organized

This book is organized in the following parts. Each part contains information about one of the indexing tools provided with OnDemand:

- Part 1, “OS/400 indexer reference” on page 1 explains how to use the administrative client graphical tool to define the index criteria that the OS/400® indexer uses to locate and create index data for your spooled files.
- Part 2, “PDF indexer reference” on page 3 describes how to use the OnDemand PDF Indexer to generate index data for Adobe PDF files
- Part 3, “Generic indexer reference” on page 39 describes how to use the OnDemand Generic Indexer to specify index data for other types of input data

Prerequisite and related information

Use the IBM iSeries Information Center as your starting point for looking up iSeries technical information.

You can access the Information Center two ways:

- From the following Web site: <http://www.ibm.com/eserver/iseries/infocenter>
- From CD-ROMs that ship with your Operating System/400® order: *iSeries Information Center*, SK3T-4091-02. This package also includes the PDF versions of iSeries manuals, *iSeries Information Center: Supplemental Manuals*, SK3T-4092-01, which replaces the Softcopy Library CD-ROM.

The Information Center contains advisors and important topics such as Java™, TCP/IP, Web serving, secured networks, logical partitions, clustering, CL commands, and system application programming interfaces (APIs). It also includes links to related IBM Redbooks™ and Internet links to other IBM Web sites such as the IBM home page.

Other information available on the World Wide Web

More iSeries information is available on the World Wide Web. You can access general information from the iSeries home page, which is at the following Web site: <http://www-1.ibm.com/servers/eserver/iseries/>

To access workshops on advanced iSeries functions, use the Technical Studio, located at: <http://www.iseries.ibm.com/tstudio/>

Worldwide, you can read about, select, order and take delivery of iSeries program temporary fixes (PTF) over the Internet. iSeries Internet PTFs (downloads) and Preventive Service Planning (PSP) information are available at the following Internet location: <http://as400service.ibm.com>

iSeries Navigator

IBM iSeries Navigator is a powerful graphical interface for managing your iSeries servers. iSeries Navigator functionality includes system navigation, configuration, planning capabilities, and online help to guide you through your tasks. iSeries Navigator makes operation and administration of the server easier and more productive and is the only user interface to the new, advanced features of the OS/400. It also includes Management Central for managing multiple servers from a central system.

You can find more information on iSeries Navigator in the IBM iSeries Information Center and at the following Web site:
<http://www.ibm.com/eserver/series/navigator/>

How to send your comments

Your feedback is important in helping to provide the most accurate and high-quality information. Please send any comments that you have about this publication.

- If you prefer to send comments by FAX, use either of the following numbers:
 - United States, Canada, and Puerto Rico: 1-800-937-3430
 - Other countries: 1-507-253-5192
- If you prefer to send comments electronically, use one of these e-mail addresses:
 - Comments on books: RCHCLERK@us.ibm.com
 - The publication number of a book
 - The page number or topic of a book to which your comment applies

Summary of changes

This edition of *IBM Content Manager OnDemand for iSeries Common Server: Indexing Reference* contains new technical information. There may be some instances where changes were made, but change bars are missing. Significant changes to note are:

You can automate the loading of non-spoiled file data such as PC files in IFS with the Start Monitor for OnDemand (STRMONOND) command using *DIR (directory) for the TYPE parameter. See Appendix A of the *IBM Content Manager OnDemand for iSeries Common Server: Administration Guide* for information on the STRMONOND command.

Additional keywords have been added to many OnDemand commands to more precisely identify the spooled file that the command will use. The new keywords correspond to the same new keywords available for OS/400 spooled file commands, allowing you to specify the system on which the spooled file was created, as well as the spooled file creation date and time.

Portable Application Solutions Environment (PASE), a product option of OS/400, is now an optional software prerequisite for the OnDemand Common Server. PASE is required if you plan to use the new OnDemand Common Server text search function for AFPDS documents. It is also possible that, in the future, other new functions of OnDemand may require PASE.

Additions and enhancements have been made to the sample programs for both Common Server and Spool File Archive. Sample programs for Common Server can be found in QSAMPLES2 source file in library QRDARS. Sample programs for Spool File Archive can be found in QSAMPLES source file in library QRDARS.

Record Archive provides commands and application programming interfaces (APIs) that let you store and retrieve data records on optical media for users who only require occasional access to historical data. At Version 5 Release 2, this product option is provided for existing Record Archive customers to use, but there are no planned enhancements. Documentation can be found in OnDemand publications from previous releases. Please talk to your software provider about other options, such as compressed DASD.

Part 1. OS/400 indexer reference

The OS/400 indexer is the most common OnDemand indexer used for OS/400 spooled files. It is called by the ADDRPTOND command for SCS, SCS-extended, Advanced Function Presentation™ (AFP™), and LINE spooled files. You use the OnDemand administrative client's graphical indexing tool to define the index criteria that the OS/400 indexer uses to locate and create index data for your spooled files.

The graphical tool can be invoked in one of two ways:

- By clicking the Select Sample Data button within the Report Wizard, or
- Selecting Sample Data and clicking the Modify button on the Indexer Information panel while creating an Application

OnDemand will use this OS/400 indexer by default for SCS, SCS-extended, AFP, and LINE spooled files. See the Report Wizard section in the Introduction of the *IBM Content Manager OnDemand for iSeries Common Server: Administration Guide* for more information on the Report Wizard. See the section on Adding the Application in the Examples chapter of the *IBM Content Manager OnDemand for iSeries Common Server: Administration Guide* for more information on defining an application without using the Report Wizard.

Part 2. PDF indexer reference

This part of the book provides information about the OnDemand PDF indexer. You can use the PDF indexer to extract index data from and generate index data about Adobe PDF files that you want to store in OnDemand.

Chapter 1. Overview

What is the PDF indexer?

The OnDemand PDF indexer is a program that you can use to extract index data from and generate index data about Adobe PDF input files. The index data can enhance your ability to store, retrieve, and view documents with OnDemand. The PDF indexer supports PDF Version 1.3 input and output data streams. For more information about the PDF data stream, see the *Portable Document Format Reference Manual*, published by Adobe Systems Incorporated. Adobe also provides online information with the Acrobat Exchange and Acrobat Distiller products, including online guides for Adobe Capture, PDFWriter, Distiller, and Exchange.

You define and store PDF documents on the server using standard OnDemand functions. You must define an OnDemand application and application group. As part of the application, you must define the indexing parameters used by the PDF indexer to process input files. You can automate the indexing and loading of data by using special parameters of the ADDRPTOND (using *STMF for the INPUT parameter) or STRMONOND (using *DIR for the TYPE parameter) commands or the ARSLOAD API program. See the Command Reference appendix of the *IBM Content Manager OnDemand for iSeries Common Server: Administration Guide* for more information on the ADDRPTOND and STRMONOND commands. See the API Reference appendix of the *IBM Content Manager OnDemand for iSeries Common Server: Administration Guide* for more information on the ARSLOAD API program and its parameters.

After you index and store input files in OnDemand, you use the OnDemand client program to view the PDF document or documents created during the indexing and loading process. You can also print pages of the PDF document you are viewing from the OnDemand client program.

Figure 1 on page 6 illustrates the process of indexing and loading PDF input files.

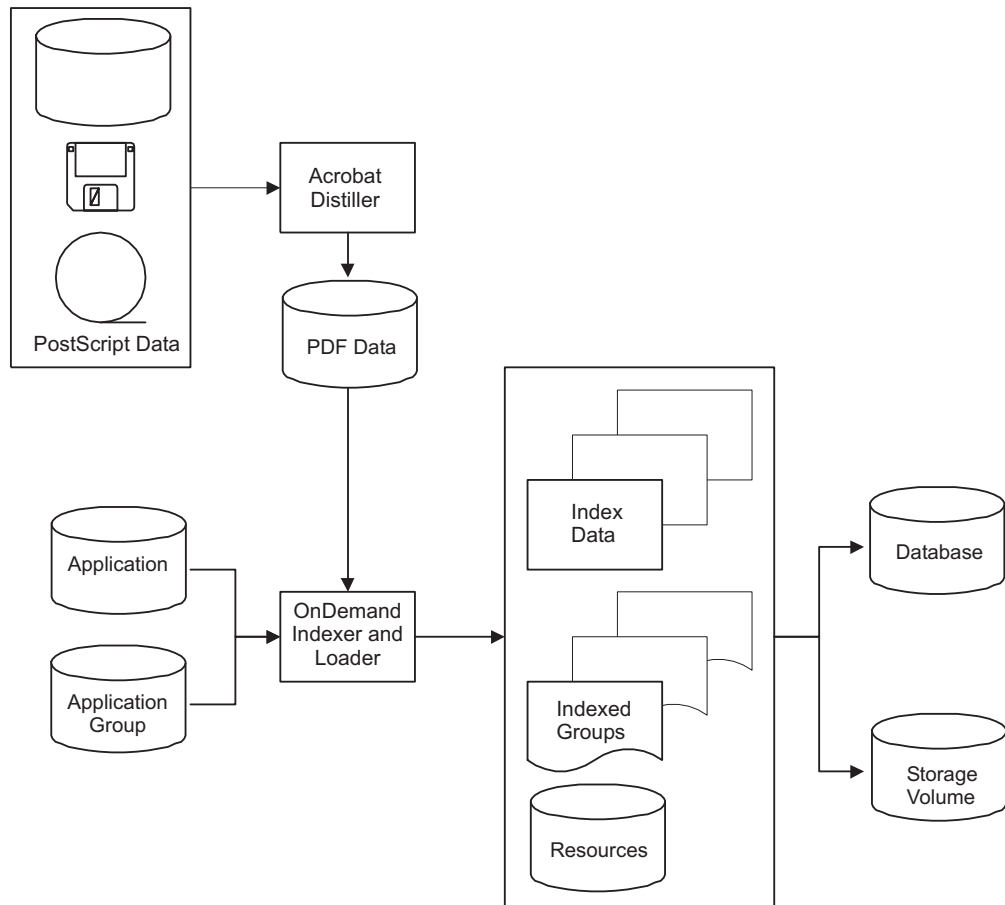

Figure 1. Processing PDF input files in OnDemand

The PDF indexer processes PDF input files. A PDF file is a distilled version of a PostScript file, adding structure and efficiency.

OnDemand retrieves processing information from application and application group definitions that are stored in the database. The application definition identifies the type of input data, the indexing program used to index the input files, the indexing parameters, and other information about the input data. The application group identifies the database and storage management characteristics of the data. You can use the administrative client to create the application and the indexing parameters.

When OnDemand processes a PDF input file and the application Indexing Information page specifies PDF as the indexer, it automatically calls the PDF indexer to process the input file. The PDF indexer processes the PDF input file with indexing parameters that determine the location and attributes of the index data. The PDF indexer extracts index data from the PDF file and generates an index file and an output file. The output file contains groups of indexed pages. A group of indexed pages can represent the entire input file or, more typically, one or more pages from the input file. If the input file contains logical groups of pages, such as statements or policies, the PDF indexer can create an indexed group for each statement or policy in the input file. That way, users can retrieve a specific statement or set of statements, rather than the entire file. After indexing the data, OnDemand stores the index data in the database and the indexed groups on disk or archive storage volumes.

How OnDemand uses index information

Every item stored in OnDemand is indexed with one or more *group-level* indexes. Groups are determined when the value of an index changes (for example, account number). When you load a PDF file into the system, OnDemand invokes the PDF indexer to process the indexing parameters and create the index data. OnDemand then loads the index data into the database, storing the group-level attribute values that the PDF indexing program extracted from the data into their corresponding database fields. Figure 2 illustrates the index creation and data loading process.

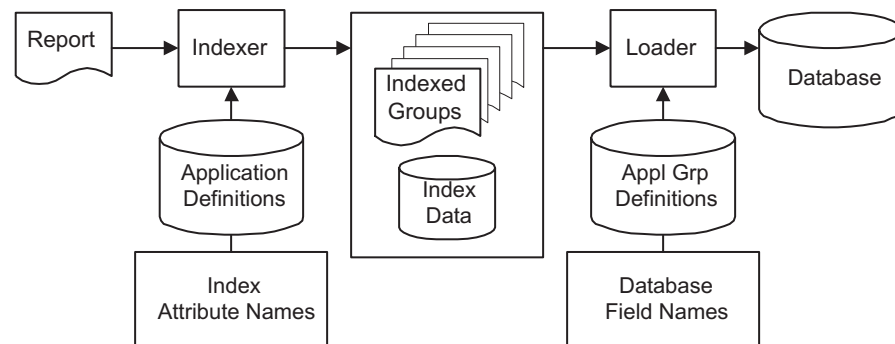

Figure 2. Indexing and loading data

You typically create an application for each report that you plan to store in OnDemand. When you create an application, you define the indexing parameters that the indexing program uses to process the report and create the index data that is loaded into the database. For example, an INDEX parameter includes an attribute name and identifies the FIELD parameter that the indexing program uses to locate the attribute value in the input data. When you create an application, you must assign the application to an application group. The attribute name you specify on an INDEX parameter should be the same as the name of the application group database field into which you want OnDemand to store the index values.

You define database fields when you create an application group. OnDemand creates a column in the application group table for each database field that you define. When you index a report, you create index data that contains index field names and index values extracted from the report. OnDemand stores the index data into the database fields.

To search for reports stored in OnDemand, the user opens a folder. The search fields that appear when the user opens the folder are mapped to database fields in an application group (which, in turn, represent index attribute names). The user constructs a query by entering values in one or more search fields. OnDemand searches the database for items that contain the values (index attribute values) that match the search values entered by the user. Each item contains group-level index information. OnDemand lists the items that match the query. When the user selects an item for viewing, the OnDemand client program retrieves the selected item from disk or archive storage.

Processing PDF input files with the graphical indexer

This section describes how to use the graphical indexer to create indexing information for PDF input files.

Important: If you plan to use the report wizard or the graphical indexer to process PDF input files, then you must first install Adobe Acrobat or Adobe Acrobat Approval on the PC from which you plan to run the administrative client. You must purchase Adobe Acrobat and Adobe Acrobat Approval from Adobe.

OnDemand provides the ARSPDF32.API file to enable PDF viewing from the client. If you install the client after you install Adobe Acrobat, then the installation program will copy the API file to the Acrobat plug-in directory. If you install the client before you install Adobe Acrobat, then you must copy the API file to the Acrobat plug-in directory. Also, if you upgrade to a new version of Acrobat, then you must copy the API file to the new Acrobat plug-in directory. The default location of the API file is \Program Files\IBM\OnDemand32\PDF. The default Acrobat plug-in directory is \Program Files\Adobe\Acrobat x.y\Acrobat\Plug_ins, where x.y is the version of Acrobat, for example, 4.0, 5.0, and so forth.

Beginning with Version 5.2, you can define indexing information in a visual environment. You begin by opening a sample input file with the graphical indexer. You can run the graphical indexer from the report wizard or by choosing the sample data option from the Indexing Information page of the application. After you open an input file in the graphical indexer, you define triggers, fields, and indexes. The PDF indexer uses the triggers, fields, and indexes to locate the beginning of a document in the input data and extract index values from the input data. Once you have defined the triggers, fields, and indexes, you can save them in the application so that OnDemand can use them later on to process the input files that you load into the system.

You define a trigger, field, or index by drawing a box around a text string with the mouse and then specifying properties. For example, to define a trigger that identifies the beginning of a document, you could draw a box around the text string Account Number on the first page of a statement in the input file. Then, on the Add a Trigger dialog box, you would accept the default values provided, such as the location of the text string on the page. When processing an input file, the PDF indexer attempts to locate the specified string in the specified location. When a match occurs, the PDF indexer knows that it has found the beginning of a document. The fields and indexes are based on the location of the trigger.

The PDF file that you open with the graphical indexer should contain a representative sample of the type of input data that you plan to load into the system. For example, the sample input file must contain at least one document. A good sample should contain several documents so that you can verify the location of the triggers, fields, and indexes on more than one document. The sample input file must contain the information that you need to identify the beginning of a document in the input file. The sample input file should also contain the information that you need to define the indexes. When you load an input file into the system, the PDF indexer will use the indexing information that you create to locate and extract index values for each document in the input file.

The following example describes how to use the graphical indexer from the report wizard to create indexing information for an input file. The indexing information consists of a trigger that uniquely identifies the beginning of a document in the input file and the fields and indexes for each document.

1. To begin, start the administrative client.

2. Log on to a server.
3. Start the report wizard by clicking the Report Wizard icon on the toolbar. The report wizard opens the Sample Data dialog box.
4. Click Select Sample Data to open the Open dialog box. **Note:** The Sample Data is limited to a PC file when using the graphical PDF indexer. The graphical PDF indexer is designed to work with workstation PDF files, not PDF spooled files in an output queue on the iSeries server.
5. Type the name or full path name of a file in the space provided or use the Look in or Browse commands to locate a file.
6. Click Open. The graphical indexer opens the input file in the report window.
7. Press F1 to open the main help topic for the report window. The main help topic contains general information about the report window and contains links to other topics that describe how to add triggers, fields, and indexes. Under Options and Commands, click Indexer Information page to open the Indexing Commands topic. (You can also use the content help tool to display information about the icons on the toolbar.) Under Tasks, Indexer Information page, click Adding a trigger (PDF).
8. Close any open help topics and return to the report window.
9. Define a trigger.
 - Find a text string that uniquely identifies the beginning of a document. For example, Account Number, Invoice Number, Customer Name, and so forth.
 - Using the mouse, draw a box around the text string. Start just outside of the upper left corner of the string. Click and hold mouse button one. Drag the mouse towards the lower right corner of the string. As you drag the mouse, the graphical indexer uses a dotted line to draw a box. When you have enclosed the text string completely inside of a box, release the mouse button. The graphical indexer highlights the text string inside of a box.
 - Click the Define a Trigger icon on the toolbar to open the Add a Trigger dialog box. Verify the attributes of the trigger. For example, the text string that you selected in the report window should be displayed under Value; for Trigger1, the Pages to Search should be set to Every Page. Click Help for assistance with the other options and values that you can specify.
 - Click OK to define the trigger.
 - To verify that the trigger uniquely identifies the beginning of a document, first put the report window in display mode. Then click the Select tool to open the Select dialog box. Under Triggers, double click the trigger. The graphical indexer highlights the text string in the current document. Double click the trigger again. The graphical indexer should highlight the text string on the first page of the next document. Use the Select dialog box to move forward to the first page of each document and return to the first document in the input file.
 - Put the report window in add mode.
10. Define a field and an index.
 - Find a text string that can be used to identify the location of the field. The text string should contain a sample index value. For example, if you want to extract account number values from the input file, then find where the account number is printed on the page.
 - Using the mouse, draw a box around the text string. Start just outside of the upper left corner of the string. Click and hold mouse button one. Drag the mouse towards the lower right corner of the string. As you drag the mouse, the graphical indexer uses a dotted line to draw a box. When you

- have enclosed the text string completely inside of a box, release the mouse button. The graphical indexer highlights the text string inside of a box.
 - Click the Define a Field icon on the toolbar to open the Add a Field dialog box.
 - On the Field Information page, verify the attributes of the index field. For example, the text string that you selected in the report window should be displayed under Reference String; the Trigger should identify the trigger on which the field is based. Click Help for assistance with the options and values that you can specify.
 - On the Database Field Attributes page, verify the attributes of the database field. In the Database Field Name space, enter the name of the application group field into which you want OnDemand to store the index value. In the Folder Field Name space, enter the name of the folder field that will appear on the client search screen. Click Help for assistance with the other options and values that you can specify.
 - Click OK to define the field and index.
 - To verify the locations of the fields, first put the report window in display mode. The fields should have a blue box drawn around them. Next, click the Select tool to open the Select dialog box. Under Fields, double-click Field 1. The graphical indexer highlights the text string in the current document. Double click Field 1 again. The graphical indexer should move to the next document and highlight the text string. Use the Select dialog box to move forward to each document and display the field. Then return to the first document in the input file.
 - Put the report window in add mode.
11. Click the Display Indexer Parameters tool to open the Display Indexer Parameters dialog box. The Display Indexer Parameters dialog box lists the indexing parameters that the PDF indexer will use to process the input files that you load into the application. At a minimum, you need one trigger, one field, and one index. See Chapter 3, "Parameter reference" on page 17 for details about the indexing parameters.
 12. When you have finished defining all of the triggers, fields, and indexes, close the report window.
 13. Click Yes to save the changes to the indexer parameters.
 14. On the Sample Data window, click Next to continue with the report wizard.

Manually indexing input data

Note: If you prefer creating your own PDF indexing parameters manually rather than using the graphical PDF indexer, you can use the instructions in the remainder of this chapter to do so.

Indexing concepts

Indexing parameters include information that allow the PDF indexer to identify key items in the print data stream, *tag* these items, and create *index elements* pointing to the tagged items. OnDemand uses the tag and index data for efficient, structured search and retrieval. You specify the index information that allows the PDF indexer to segment the data stream into individual items, called *groups*. A group is a collection of one or more pages, such as a bank statement, insurance policy, phone bill, or other logical segment of a report. The PDF indexer creates indexes for each group when the value of an index changes (for example, account number).

A tag is made up of an *attribute name*, for example, Customer Name, and an *attribute value*, for example, Earl Hawkins. Tags also include information that tell the PDF indexer where to locate the attribute value on a page. For example, a tag used to collect customer name index values provides the PDF indexer with the starting and ending position on the page where the customer name index values appear. The PDF indexer generates index data and stores it in a generic index file.

Coordinate system

The location of the text strings the PDF indexer uses to determine the beginning of a group and index values are described as x and y pairs in a coordinate system imposed on the page. For each text string, you identify its upper left and lower right position on the page. The upper left corner and lower right corner form a string box. The string box is the smallest rectangle that completely encloses the text string. The origin is in the upper left hand corner of the page. The x coordinate increases to the right and y increases down the page. You also identify the page on which the text string appears. For example, the text string Customer Name, that starts 4 inches to the right and 1 inch down and ends 5.5 inches to the right and 1.5 inches down on the first page in the input file can be located as follows:

```
ul(4,1),lr(5.5,1.5),1,'Customer Name'
```

OnDemand provides the ARSPDUMP command to help you identify the locations of text strings on the page.

Indexing parameters

Processing parameters can contain index and conversion parameters, options, and values. For most reports, the PDF indexer requires at least three indexing parameters to generate index data:

- **TRIGGER**

The PDF indexer uses triggers to determine where to locate data. A trigger instructs the PDF indexer to look for certain information in a specific location on a page. When the PDF indexer finds the text string in the input file that contains the information specified in the trigger, it can begin to look for index information.

- The PDF indexer compares words in the input file with the text string specified in a trigger.
- The location of the trigger string value must be identified using the x,y coordinate system and page offsets.
- A maximum of 16 triggers can be specified.
- All triggers must match before the PDF indexer can begin to locate index information.

- **FIELD**

The field parameter specifies the location of the data that the PDF indexer uses to create index values.

- Field definitions are based on TRIGGER1 by default, but can be based on any of 16 TRIGGER parameters.
- The location of the field must be identified using the x,y coordinate system and page offsets.
- A maximum of 32 fields can be defined.
- A field parameter can also specify all or part of the actual index value stored in the database.

- **INDEX**

The index parameter is where you specify the attribute name and identify the field or fields on which the index is based. We strongly encourage you to name the attribute the same as the application group database field name.

- The PDF indexer creates indexes for a group of one or more pages.
- You can concatenate field parameters to form an index.
- A maximum of 32 index parameters can be specified.

The PDF indexer creates a new group and extracts new index values when one or more of the index values change.

Figure 3 depicts a portion of a page from a sample input file. We've enclosed the text strings that determine the beginning of a group and the index values in rectangles.

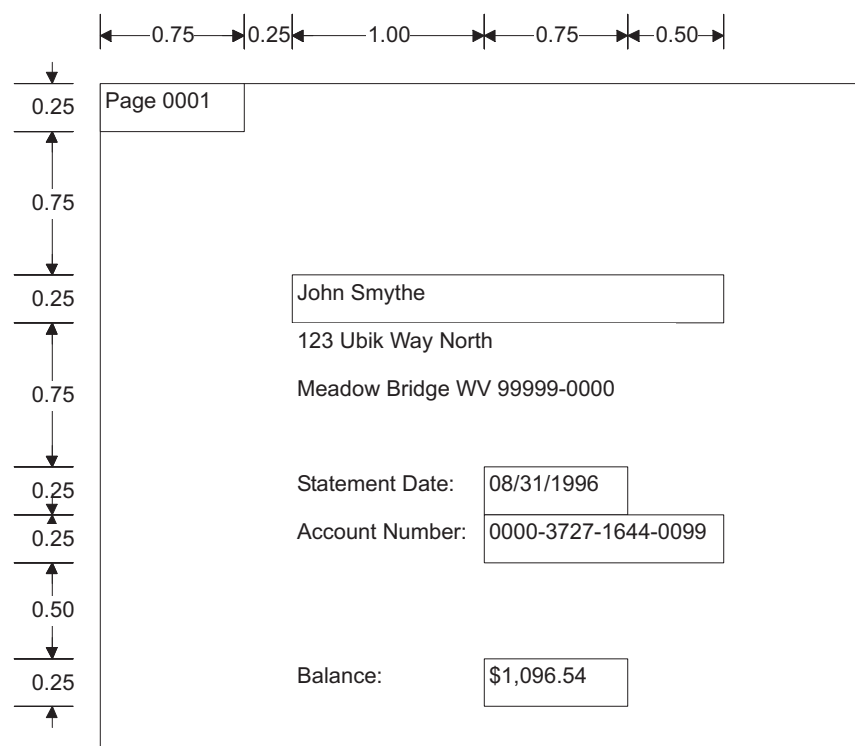

Figure 3. Indexing data with the PDF indexer

TRIGGER parameters tell the PDF indexer how to identify the beginning of a group in the input. The PDF indexer requires one TRIGGER parameter to identify the beginning of a group (statement) in the sample file. FIELD parameters determine the location of index values in a statement. Fields are based on the location of trigger records. INDEX parameters identify the attribute names of the index fields. Indexes are based on one or more field parameters. The following parameters could be used to index the report depicted in Figure 3. See Chapter 3, "Parameter reference" on page 17 for details about the parameter syntax.

- Define a trigger to search each page in the input data for the text string that identifies the start of a group (statement):
`TRIGGER1=ul(0,0),lr(.75,.25),*, 'Page 0001'`
- Define fields to identify the location of index data. For the sample report, we might define four fields:
 - FIELD1 identifies the location of customer name index values.

- ```
FIELD1=ul(1,1),lr(3.25,1.25),0
```
- FIELD2 identifies the location of statement date index values.  
FIELD2=ul(2,2),lr(2.75,2.25),0
  - FIELD3 identifies the location of account number index values.  
FIELD3=ul(2,2.25),lr(3.25,2.5),0
  - FIELD4 identifies the location of the balance index values.  
FIELD4=ul(2,3),lr(2.75,3.25),0
  - Define indexes to identify the attribute name for an index value and the field parameter used to locate the index value.
    - INDEX1 identifies the customer name, for values extracted using FIELD1.  
INDEX1='cust\_name',FIELD1
    - INDEX2 identifies the statement date, for values extracted using FIELD2.  
INDEX2='sdate',FIELD2
    - INDEX3 identifies the account number, for values extracted using FIELD3.  
INDEX3='acct\_num',FIELD3
    - INDEX4 identifies the balance, for values extracted using FIELD4.  
INDEX4='balance',FIELD4

---

## How to create indexing parameters

There are two parts to creating indexing parameters. First, process sample input data to determine the *x,y* coordinates of the text strings the PDF indexer uses to identify groups and locate index data. Then, create the indexing parameters using the administrative client.

OnDemand provides the ARSPDUMP command to help you determine the location of trigger and field string values in the input data. The ARSPDUMP command processes one or more pages of sample report data and generates an output file. The output file contains one record for each text string on a page. Each record contains the *x,y* coordinates for a box imposed over the text string (upper left, lower right).

The process works as follows:

- Obtain a printed copy of the sample report.
- Identify the string values that you want to use to locate triggers and fields
- Identify the number of the page where each string value appears. The number is the *sheet number*, not the page identifier. The sheet number is the order of the page as it appears in the file, beginning with the number 1 (one), for the first page in the file. A page identifier is user-defined information that identifies each page (for example, iv, 5, and 17-3).
- Process one or more pages of the report with the ARSPDUMP command.
- In the output file, locate the records that contain the string values and make a note of the *x,y* coordinates.
- Create TRIGGER and FIELD parameters using the *x,y* coordinates, page number, and string value.

Indexing parameters are part of the OnDemand application. The administrative client provides an edit window you can use to maintain indexing parameters for the application.

---

## Chapter 2. System considerations

---

### System limitations

If you are using the OnDemand PDF indexer to generate index data for PostScript and PDF files that are created by user-defined programs, you need to keep the following in mind:

- The PDF indexer can process PDF input files that are up to 2 GB in size
- The PDF indexer supports DBCS languages. However, IBM does not provide any DBCS fonts. You can purchase DBCS fonts from Adobe. The PDF indexer supports all DBCS fonts, except encrypted Japanese fonts.
- Input data delimited with PostScript Passthrough markers cannot be indexed
- The Adobe Toolkit does not validate link destinations or bookmarks to other pages in a document or to other documents. Links or bookmarks may or may not resolve correctly, depending on how you segment your documents.
- If a font is referenced but not embedded in a PDF file, the Acrobat viewing software attempts to find the font using information contained in the PDF font descriptor. If the Acrobat viewing software finds the font, it uses the font to display the text. If the Acrobat viewing software does not find the font, it displays the text using a substitute Type 1 font.

---

### Input data requirements

The PDF indexer processes PDF input data. PostScript data generated by applications must be processed by Acrobat Distiller before you run the PDF indexer. The online documentation provided with Acrobat Distiller describes methods you can use to generate PDF data.

If you plan to automate the data indexing and loading process on the OnDemand server, the input file name must identify the application group and application to load. Use the following convention to name your input files:

`MVS.JOBNAME.DATASET.FORMS.YYDD.HHMMSS.PDF`

By default, the ARSLOAD program uses the FORMS part of the filename to identify the application group to load. You can use the -G parameter to specify a different part of the filename that identifies the application group. For example, `arsload -G JOBNAME`. If the application group contains more than one application, you must identify the application to load. Otherwise the load will fail. For example, to use the DATASET part of the filename to identify the application, run the ARSLOAD program with the -A DATASET parameter. Choose one of the MVS<sup>™</sup>, JOBNAME, DATASET, and FORMS parts of the filename to identify the application group and application.

**Note:** The case of the identifier PDF is ignored. Application group and application names are case sensitive and may include special characters such as the blank character.

---

### NLS considerations

DBCS languages are not currently supported by the PDF indexer.

Data values that you specify on TRIGGER and FIELD parameters must be encoded in the same code page as the document. For example, if the characters in the document are encoded in code page 500, any data values that you specify on TRIGGER and FIELD parameters must be encoded in code page 500. Examples of data values that you might specify include TRIGGER string values and FIELD default and constant values.

For more information about NLS in OnDemand, see the *IBM Content Manager OnDemand for iSeries Common Server Planning and Installation Guide*.

---

## Chapter 3. Parameter reference

This parameter reference assumes that you will use the ARSLOAD program to process your input files. When you use the ARSLOAD program to process input files, the PDF indexer ignores any values that you may provide for the INDEXDD, INPUTDD, MSGDD, OUTPUTDD, and PARMDD parameters. If you run the ARSPDOCI program from the command prompt or call it from a user-defined program, then you must provide values for the INPUTDD, OUTPUTDD, and PARMDD parameters and verify that the default values for the INDEXDD and MSGDD parameters are correct.

---

### COORDINATES

Identifies the metrics used for  $x,y$  coordinates in the FIELD and TRIGGER parameters.

**Required?**

No

**Default Value**

IN

#### Syntax

COORDINATES=*metric*

#### Options and values

The *metric* can be:

IN

The coordinate metrics are specified in inches (the default).

CM

The coordinate metrics are specified in centimeters.

MM

The coordinate metrics are specified in millimeters.

---

### FIELD

Identifies the location of index data and can provide default and constant index values. You must define at least one field. You can define up to 32 fields. You can define two types of fields: a *trigger field*, which is based on the location of a trigger string value and a *constant field*, which provides the actual index value that is stored in the database.

**Required?**

Yes

**Default Value**

<none>

#### Trigger field syntax

FIELD*n*=ul( $x,y$ ),lr( $x,y$ ),page[, (TRIGGER=*n*,BASE={0 | TRIGGER},  
MASK='field\_mask',DEFAULT='value')]

## Options and values

*n*

The field parameter identifier. When adding a field parameter, use the next available number, beginning with 1 (one).

**ul**(*x,y*)

The coordinates for the upper left corner of the field string box. The field string box is the smallest rectangle that completely encloses the field string value (one or more words on the page). The PDF indexer must find the field string value inside the field string box. The supported range of values is 0 to 45, page width and length, in inches.

**lr**(*x,y*)

The coordinates for the lower right corner of the field string box. The field string box is the smallest rectangle that completely encloses the field string value (one or more words on the page). The PDF indexer must find the field string value inside the field string box. The supported range of values is 0 to 45, page width and length, in inches.

*page*

The sheet number where the PDF indexer begins searching for the field, relative to a trigger or 0 (zero) for the same page as the trigger. If you specify BASE=0, the *page* value can be -16 to 16. If you specify BASE=TRIGGER, the *page* value must be 0 (zero), which is relative to the sheet number where the trigger string value is located.

**TRIGGER**=*n*

Identifies the trigger parameter used to locate the field. This is an optional keyword, but the default is TRIGGER1. Replace *n* with the number of a defined TRIGGER parameter.

**BASE**={0 | TRIGGER}

Determines whether the PDF indexer uses the upper left coordinates of the trigger string box to locate the field. Choose from 0 (zero) or TRIGGER. If BASE=0, the PDF indexer adds zero to the field string box coordinates. If BASE=TRIGGER, the PDF indexer adds the upper left coordinates of the location of the trigger string box to the coordinates provided for the field string box. This is an optional keyword, but the default is BASE=0.

You should use BASE=0 if the field data always starts in a specific area on the page. You should use BASE=TRIGGER if the field is not always located in the same area on every page, but is always located a specific distance from a trigger. This capability is useful when the number of lines on a page varies, causing the location of field values to change. For example, given the following parameters:

```
TRIGGER2=ul(4,4),lr(5,8),1,'Total'
FIELD2=ul(1,0),lr(2,1),0,(TRIGGER=2,BASE=TRIGGER)
```

The trigger string value can be found in a one by four inch rectangle. The PDF indexer always locates the field in a one inch box, one inch to the right of the location of the trigger string value. If the PDF indexer finds the trigger string value in location ul(4,4),lr(5,5), it attempts to find the field in location ul(5,4),lr(6,5). If the PDF indexer finds the trigger string value in location ul(4,6),lr(5,7), it attempts to find the field in location ul(5,6),lr(6,7).

**Note:** Beginning with Version 5.2, a field that is based on the location of a trigger (BASE=TRIGGER) can be defined at any location on the page that contains the trigger. Previously, a field that was based on the location of a trigger had to be defined to the right and below the upper left point of

the trigger. With this change, the  $x$  or  $y$  values can be negative, so long as the resulting absolute field coordinates of the field string rectangle are still in the range of  $0 \leq x \leq 45$  and  $0 \leq y \leq 45$ . The  $ul(x,y)$  and  $lr(x,y)$  coordinates of the FIELD parameter are relative offsets from the  $ul(x,y)$  coordinates of the trigger. For example, suppose the field string rectangle is located at  $ul(1,1)$ ,  $lr(2,2)$  which is an absolute location on the page. If the trigger string rectangle is located at  $ul(5,5)$ ,  $lr(7,7)$ , then the field coordinates would be  $ul(-4,-4)$ ,  $lr(-3,-3)$ .

**MASK**=*'field\_mask'*

The pattern of symbols that the PDF indexer matches to data located in the field. When you define a field that includes a mask, an INDEX parameter based on the field cannot reference any other fields. Valid mask symbols can include:

@ Matches alphabetic characters. For example:

MASK='@@@@@@@@@@@@@@@'

Causes the PDF indexer to match a 15-character alphabetic field, such as a name.

# Matches numeric characters. For example:

MASK='#####'

Causes the PDF indexer to match a 10-character numeric field, such as an account number.

- Matches any non-blank character.

^ Matches any non-blank character.

% Matches the blank character and numeric characters.

= Matches any character.

**Note:** The string that you specify for the mask can contain any character. For example, given the following definitions:

```
TRIGGER2=*,25,'ACCOUNT'
FIELD2=0,38,11,(TRIGGER=2,BASE=0,MASK='000-###-#')
```

The PDF indexer selects the field only if the data in the field columns contains an eleven-character string comprised of any letter, three zeros, a dash character, any four numbers, a dash character, and any number.

**DEFAULT**=*'value'*

Defines the default index value, when there are no words within the coordinates provided for the field string box.

For example, assume that an application program generates statements that contain an audit field. The contents of the field can be PASSED or FAILED. However, if a statement has not been audited, the application program does not generate a value. In that case, there are no words within the field string box. To store a default value in the database for unaudited records, define the field as follows:

FIELD3= $ul(8,1)$ , $lr(8.5,1.25)$ ,1,(DEFAULT='NOT AUDITED')

The PDF indexer assigns the index associated with FIELD3 the value NOT AUDITED, if the field string box is blank.

## Examples

The following field parameter causes the PDF indexer to locate the field at the coordinates provided for the field string box. The field is based on TRIGGER1 and located on the same page as TRIGGER1. We specify BASE=0 because the field string box always appears in a specific location on the page.

```
TRIGGER1=u1(0,0),lr(.75,.25),*, 'Page 0001'
FIELD1=u1(1,1),lr(3.25,1.25),0,(TRIGGER=1,BASE=0)
```

## Constant field syntax

*FIELDn='constant'*

### Options and values

*n*

The field parameter identifier. When adding a field parameter, use the next available number, beginning with 1 (one).

*'constant'*

The literal (constant) string value of the field. This is the index value stored in the database. The constant value can be 1 to 250 bytes in length. The PDF indexer does not validate the type or content of the constant.

## Examples

The following field parameter causes the PDF indexer to store the same text string in each INDEX1 value it creates.

```
FIELD1='000000000'
INDEX1='acct',FIELD1
```

The following field parameters cause the PDF indexer to concatenate a constant value with the index value extracted from the data. The PDF indexer concatenates the constant value specified in the FIELD1 parameter to each index value located using the FIELD2 parameter. The concatenated string value is stored in the database. In this example, the account number field in the data is 14 bytes in length. However, the account number in the database is 19 bytes in length. Use a constant field to concatenate a constant five byte prefix (0000-) to all account numbers extracted from the data.

```
FIELD1='0000-'
FIELD2=u1(2,2),lr(2.5,2.25),0,(TRIGGER=1,BASE=0)
INDEX1='acct_num',FIELD1,FIELD2
```

## Related parameters

INDEX parameter on page 21.

TRIGGER parameter on page 25.

---

## FONTLIB

Identifies the directory or directories in which fonts are stored. Specify any valid path. The PDF indexer searches for fonts in the order that the paths are listed. If a font is referenced in an input file but not embedded in the file, the PDF indexer attempts to locate the font in the directory or directories listed on the FONTLIB parameter. If the font is located, the PDF indexer adds it to the output file. If the font cannot be located, the Adobe viewing software displays the text using a substitute Type 1 font when the document is retrieved by a client program.

### Required?

No

**Default Value**  
/QIBM/ProdData/OnDemand/Adobe/fonts

## Syntax

**FONTLIB**=*pathlist*

## Options and values

The *pathlist* is a colon-separated string of one or more valid path names. For example:

/QIBM/ProdData/OnDemand/Adobe/fonts:/mycustom/fonts

The PDF indexer searches the paths in the order in which they are specified. Delimit path names with the colon (:) character.

---

## INDEX

Identifies the index name and the field or fields on which the index is based. You must specify at least one index parameter. You can specify up to 32 index parameters. When you create index parameters, we strongly encourage you to name the index the same as the application group database field name.

### Required?

Yes

### Default Value

<none>

## Syntax

**INDEX***n*='name',**FIELD***nn*[...**FIELD***nn*]

## Options and values

*n*

The index parameter identifier. When adding an index parameter, use the next available number, beginning with 1 (one).

'name'

Determines the index name associated with the actual index value. For example, assume INDEX1 is to contain account numbers. The string *acct\_num* would be a meaningful index name. The index value of INDEX1 would be an actual account number, for example, 000123456789.

The index name is a string from 1 to 250 bytes in length. We strongly encourage you to name the index the same as the application group database field name.

**FIELD***nn*

The name of the field parameter or parameters that the PDF indexer uses to locate the index. You can specify a maximum of 32 field parameters. Separate the field parameter names with a comma. The total length of all the specified field parameters cannot exceed 250 bytes.

## Examples

The following index parameter causes the PDF indexer to create group-level indexes for date index values (the PDF indexer supports group-level indexes only). When the index value changes, the PDF indexer closes the current group and begins a new group.

```
INDEX1='report_date',FIELD1
```

The following index parameters cause the PDF indexer to create group-level indexes for customer name and account number index values. The PDF indexer closes the current group and begins a new group when either the customer name or the account number index value changes.

```
INDEX1='name',FIELD1
INDEX2='acct_num',FIELD2
```

## Related parameters

FIELD parameter on page 17.

---

## INDEXDD

Determines the name or the full path name of the index object file. The PDF indexer writes indexing information to the index object file. If you specify the file name without a path, then the PDF indexer puts the index object file in the current directory. If you do not specify the INDEXDD parameter, then the PDF indexer writes indexing information to the file INDEX.

### Required?

No

**Note:** When you process input files with the ARSLOAD program, the PDF indexer ignores any value that you may supply for the INDEXDD parameter. If you process input files with the ARSPDOCI program, then verify the value of the INDEXDD parameter.

### Default Value

INDEX

## Syntax

INDEXDD=*filename*

## Options and values

The *filename* is a valid filename or full path name.

---

## INDEXSTARTBY

Determines the page number by which the PDF indexer must locate the first group (document) within the input file. The first group is identified when all of the triggers and fields are found. For example, with the following parameters:

```
TRIGGER1=u1(4.72,1.28),lr(5.36,1.45),*, 'ACCOUNT'
TRIGGER2=u1(6.11,1.43),lr(6.79,1.59),1, 'SUMMARY'
INDEX1='Account',FIELD1,FIELD2
FIELD1=u1(6.11,1.29).lr(6.63,1.45),2
FIELD2=u1(6.69,1.29),lr(7.04,1.45),2
INDEX2='Total',FIELD3
FIELD3=u1(6.11,1.43),lr(6.79,1.59),2
INDEXSTARTBY=3
```

The word ACCOUNT must be found on a page in the location described by TRIGGER1. The word SUMMARY must be found on a page following the page on which ACCOUNT was found, in the location specified by TRIGGER2. In addition, there must be one or more words found for fields FIELD1, FIELD2, and FIELD3 in

the locations specified by FIELD1, FIELD2, and FIELD3 which are located on a page that is two pages after the page on which TRIGGER1 was found.

In the example, the first group in the file must start on either page one, page two, or page three. If TRIGGER1 is found on page one, then TRIGGER2 must be found on page two and FIELD1, FIELD2, and FIELD3 must be found on page three.

The PDF indexer stops processing if it does not locate the first group by the specified page number. This parameter is optional, but the default is that the PDF indexer must locate the first group on the first page of the input file. This parameter is helpful if the input file contains header pages. For example, if the input file contains two header pages, you can specify a page number one greater than the number of header pages (INDEXSTARTBY=3) so that the PDF indexer will stop processing only if it does not locate the first group by the third page in the input data.

**Note:** When you use INDEXSTARTBY to skip header pages, the PDF indexer does not copy non-indexed pages to the output file or store them in OnDemand. For example, if you specify INDEXSTARTBY=3 and the first group is found on page three, then pages one and two are not copied to the output file or stored in OnDemand. If you specify INDEXSTARTBY=3 and the first group is found on page two, then page one is not copied to the output file or stored in OnDemand.

**Required?**

No

**Default Value**

1

## Syntax

INDEXSTARTBY=*value*

## Options and values

The *value* is the page number by which the PDF indexer must locate the first group (document) in the input file.

---

## INPUTDD

Identifies the name or the full path name of the PDF input file that the PDF indexer will process.

**Required?**

No

**Note:** When you process input files with the ARSLOAD program, the PDF indexer ignores any value that you may supply for the INPUTDD parameter. If you process input files with the ARSPDOCI program, then you must specify a value for the INPUTDD parameter.

**Default Value**

<none>

## Syntax

INPUTDD=*name*

## Options and values

The *name* is the file name or full path name of the input file. If you specify the file name without a path, the PDF indexer searches the current directory for the specified file.

---

### MSGDD

Determines the name or the full path name of the file where the PDF indexer writes error messages. If you do not specify the MSGDD parameter, the PDF indexer writes messages to the display (interactive) or the joblog (batch).

#### Required?

No

**Note:** When you process input files with the ARSLOAD program, the PDF indexer ignores any value that you may supply for the MSGDD parameter. If you process input files with the ARSPDOCI program, then verify the value of the MSGDD parameter.

#### Default Value

the display (interactive) or the joblog (batch), which are sometimes referred to as stderr (standard error)

## Syntax

MSGDD=*name*

## Options and values

The *name* is the file name or full path name where the PDF indexer writes error messages. If you specify the file name without a path, the PDF indexer places the error file in the current directory.

---

### OUTPUTDD

Identifies the name or the full path name of the output file.

#### Required?

No

**Note:** When you process input files with the ARSLOAD program, the PDF indexer ignores any value that you may supply for the OUTPUTDD parameter. If you process input files with the ARSPDOCI program, then you must specify a value for the OUTPUTDD parameter.

#### Default Value

<none>

## Syntax

OUTPUTDD=*name*

## Options and values

The *name* is the file name or full path name of the output file. If you specify the file name without a path, the PDF indexer puts the output file in the current directory.

---

## PARMDD

Identifies the name or the full path name of the file that contains the indexing parameters used to process the input data.

### Required?

No

**Note:** When you process input files with the ARSLOAD program, the PDF indexer ignores any value that you may supply for the PARMDD parameter. If you process input files with the ARSPDOCI program, then you must specify a value for the PARMDD parameter.

### Default Value

<none>

## Syntax

PARMDD=*name*

## Options and values

The *name* is the file name or full path name of the file that contains the indexing parameters. If you specify the file name without a path, the PDF indexer searches for the file in the current directory.

---

## TEMPDIR

Determines the name of the directory that the PDF indexer uses for temporary work space.

### Required?

No

### Default Value

/arstmp

## Syntax

TEMPDIR=*directory*

## Options and values

The *directory* is a valid directory name.

---

## TRIGGER

Identifies locations and string values required to uniquely identify the beginning of a group and the locations and string values of fields used to define indexes. You must define at least one trigger and can define up to sixteen triggers.

### Required?

Yes

### Default Value

<none>

## Syntax

TRIGGERn=ul(*x,y*),lr(*x,y*),page,'*value*'

## Options and values

*n*

The trigger parameter identifier. When adding a trigger parameter, use the next available number, beginning with 1 (one).

**ul**(*x,y*)

The coordinates for the upper left corner of the trigger string box. The trigger string box is the smallest rectangle that completely encloses the trigger string value (one or more words on the page). The PDF indexer must find the trigger string value inside the trigger string box. The supported range of values is 0 to 45, page width and length, in inches.

**lr**(*x,y*)

The coordinates for the lower right corner of the trigger string box. The trigger string box is the smallest rectangle that completely encloses the trigger string value (one or more words on the page). The PDF indexer must find the trigger string value inside the trigger string box. The supported range of values are 0 (zero) to 45, page width and length, in inches.

*page*

The page number in the input file on which the trigger string value must be located.

- For TRIGGER1, the *page* value must be an asterisk (\*), to specify that the trigger string value can be located on any page in the input file. The PDF indexer begins searching on the first page in the input file. The PDF indexer continues searching until the trigger string value is located, the INDEXSTARTBY value is reached, or the last page of the input file is searched, whichever occurs first. If the PDF indexer reaches the INDEXSTARTBY value or the last page and the trigger string value is not found, then an error occurs and indexing stops.
- For all other triggers, the *page* value can be 0 (zero) to 16, relative to TRIGGER1. For example, the page value 0 (zero) means that the trigger is located on the same page as TRIGGER1; the value 1 (one) means that the trigger is located on the page after the page that contains TRIGGER1; and so forth. For TRIGGER2 through TRIGGER16, the trigger string value can be a maximum of 16 pages from TRIGGER1.

*'value'*

The actual string value the PDF indexer uses to match the input data. The string value is case sensitive. The value is one or more words that can be found on a page.

## Examples

### TRIGGER1

The following TRIGGER1 parameter causes the PDF indexer to search the specified location on every page of the input data for the specified string. You must define TRIGGER1 and the page value for TRIGGER1 must be an asterisk.

```
TRIGGER1=ul(0,0),lr(.75,.25)*,'Page 0001'
```

### Group triggers

The following trigger parameter causes the PDF indexer to attempt to match the string value Account Number within the coordinates provided for the trigger string box. The trigger can be found on the same page as TRIGGER1.

```
TRIGGER2=ul(1,2.25),lr(2,2.5),0,'Account Number'
```

The following trigger parameter causes the PDF indexer to attempt to match the string value `Total` within the coordinates provided for the trigger string box. In this example, we've defined a one by four inch trigger string box, because the vertical position of the trigger on the page may vary. For example, assume that the page contains account numbers and balances with a total for all of the accounts listed. There can be one or more accounts listed. The location of the total varies, depending on the number of accounts listed. The field parameter is based on the trigger so that the PDF indexer can locate the field regardless of the actual location of the trigger string value. The field is a one inch box that always begins one inch to the right of the trigger. After locating the trigger string value, the PDF indexer adds the upper left coordinates of the trigger string box to the coordinates provided for the field. The trigger can be found on the page following `TRIGGER1`.

```
TRIGGER2=ul(4,4),lr(5,8),1,'Total'
FIELD2=ul(1,0),lr(2,1),0,(TRIGGER=2,BASE=TRIGGER)
```

## Related parameters

The `FIELD` parameter on page 17.

---

## Chapter 4. Message reference

---

### Introduction

The PDF indexer creates a message list at the end of each indexing run. A return code of 0 (zero) means that processing completed without any errors.

The PDF indexer detects a number of error conditions that can be logically grouped into several categories:

- **Informational**

When the PDF indexer processes a file, it issues informational messages that allow the user to determine if the correct processing parameters have been specified. These messages can assist in providing an audit trail.

- **Warning**

The PDF indexer issues a warning message and a return code of 4 (four) when the fidelity of the document may be in question.

- **Error**

The PDF indexer issues an error message and return code of 8 (eight) or 16 (sixteen) and terminates processing the current input file. Most error conditions detected by the PDF indexer fall into this category. The exact method of termination may vary. For certain severe errors, the PDF indexer may fail with a segment fault. This is generally the case when some system service fails. In other cases, the PDF indexer terminates with the appropriate error messages written either to the display (interactive) or the joblog (batch) (sometimes referred to as stderr (standard error)) or to a file. When the PDF indexer is invoked by the ARSLOAD data loading program, error messages are automatically written to the system log. If you execute the ARSPDOCI command, you can specify the name or the full path name of the file to contain processing messages with the **MSGDD** parameter.

- **Adobe Toolkit**

Messages generated by the Adobe Toolkit.

- **Internal Error**

The PDF indexer issues an error message and return code of 16 (sixteen) and terminates processing the current input file.

---

## Messages

---

**ARS4900I**    **Usage:** arspdoci [parmdd filename]  
**Version:** *version*  
**Coordinates:** Metrics (units X and Y are specified in)  
                  Inches | Centimeters | Millimeters  
**Fontlib:** Font directory  
**Inputdd:** Input filename  
**Msgdd:** Message filename - default is stdout  
**Outputdd:** Output filename pattern  
**TraceDD:** Trace file - default is stderr  
**Trace:** What to trace - default is off  
            API | WORDS | FCNS | INDEX | ALL

**Explanation:** An incorrect parameter was specified for the command.

**User Response:** Resubmit the command with the correct parameters. For more information about this command, please see Chapter 5, “ARSPDOCI reference” on page 35.

---

**ARS4901I**    *parameter*

**Explanation:** This message is for your information only.

**User Response:** No action is required.

---

**ARS4902I**    **Number of input pages =** *pages*

**Explanation:** This message is for your information only.

**User Response:** No action is required.

---

**ARS4903E**    *keyword* **keyword contains non-numeric identifier**

**Explanation:** The identifier for the specified keyword must be a number from 1 to 16 (TRIGGER parameter) or 1 to 32 (INDEX or FIELD parameter).

**User Response:** Correct the identifier and then resubmit the command.

---

**ARS4904E**    **Error allocating** *bytes* **bytes memory**

**Explanation:** The PDF indexer was unable to allocate the requested amount of memory.

**User Response:** Decrease the load on the system or increase the amount of memory available to the PDF indexer and then resubmit the command.

---

**ARS4905E**    *parameter* **parameter syntax incorrect**

**Explanation:** The syntax for the trigger, field, or index parameter is not correct.

**User Response:** Correct the parameter and then resubmit the command.

---

**ARS4906E**    **Unknown parameter:** *parameter*

**Explanation:** The specified string is not a valid PDF indexer parameter.

**User Response:** Correct the parameter and then resubmit the command.

---

**ARS4907E**    **Incorrect index file definition**

**Explanation:** The file specified for the INDEXDD file definition parameter is not a valid file name.

**User Response:** Correct the file name specified on the file definition parameter and then resubmit the command.

---

| ARS4914E              | <b>Trigger(s) not found by page <i>page</i></b>                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Explanation:</b>   | The PDF indexer did not find a trigger by the specified page number. The INDEXSTARTBY parameter determines the page number by which the PDF indexer must find a trigger and begin indexing.                                                                                                                                                                                                                                          |
| <b>User Response:</b> | Verify the page number that is specified on the INDEXSTARTBY parameter. If the page number is correct, verify the TRIGGER parameters. Then resubmit the command.                                                                                                                                                                                                                                                                     |
| ARS4915E              | <b>Field(s) not found by page <i>page</i></b>                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Explanation:</b>   | The PDF indexer did not find a field by the specified page number. The INDEXSTARTBY parameter determines the page number by which the PDF indexer must find a trigger and begin indexing for a field.                                                                                                                                                                                                                                |
| <b>User Response:</b> | Verify the page number that is specified on the INDEXSTARTBY parameter. If the page number is correct, verify the FIELD parameters. Then resubmit the command.                                                                                                                                                                                                                                                                       |
| ARS4916E              | <b>Failed Adobe Toolkit Initialization rc=<i>rcError string</i> : <i>string</i></b>                                                                                                                                                                                                                                                                                                                                                  |
| <b>Explanation:</b>   | The Adobe toolkit returned an error.                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>User Response:</b> | Verify the directories that are specified on the FONTLIB and TEMPDIR parameters. Verify the directory permissions. Verify that the directories named on the FONTLIB parameter provide access to the fonts that are required by the PDF indexer. Verify that the directory named on the TEMPDIR parameter contains sufficient free space to process the input file. If the problem persists, contact your IBM Service Representative. |

---

**ARS4917E Create of new Document Segment failed**

**Explanation:** The Adobe toolkit returned an error when trying to create a new document segment.

**User Response:** Verify the directories that are specified on the FONTLIB and TEMPDIR parameters. Verify the files and directories that are named on the INPUTDD and OUTPUTDD parameters. Verify the file and directory permissions. Verify that the directories that are named on the FONTLIB parameter provide access to the fonts that are required by the PDF indexer. Verify that the directory that is named on the TEMPDIR and OUTPUTDD parameters contains sufficient free space to process the input file. If the problem persists, contact your IBM Service Representative.

---

**ARS4918E Page extraction failed!**

**Explanation:** The Adobe toolkit returned an error when trying to extract pages for a new segment.

**User Response:** Verify the directories that are specified on the FONTLIB and TEMPDIR parameters. Verify the files and directories that are named on the INPUTDD and OUTPUTDD parameters. Verify the file and directory permissions. Verify that the directories that are named on the FONTLIB parameter provide access to the fonts that are required by the PDF indexer. Verify that the directory that is named on the TEMPDIR and OUTPUTDD parameters contains sufficient free space to process the input file. If the problem persists, contact your IBM Service Representative.

---

**ARS4919E Word search or extraction error**

**Explanation:** The Adobe toolkit returned an error while searching the PDF document.

**User Response:** Verify the directories that are specified on the FONTLIB and TEMPDIR parameters. Verify the directory permissions. Verify that the directories that are named on the FONTLIB parameter provide access to the fonts that are required by the PDF indexer. Verify that the directory named on the TEMPDIR parameter contains sufficient free space to process the input file. If the problem persists, contact your IBM Service Representative.

---

**ARS4920E Error during Distil rc =rc Error string :string Check the Distiller messages**

**Explanation:** The Acrobat Distiller returned an error while trying to distill the input file.

**User Response:** Use the Distiller output messages to determine the cause and resolution of the error. After correcting the error, resubmit the command.

---

**ARS4921E The Input file contains an unsupported data type**

**Explanation:** The input file does not contain Postscript or PDF data.

**User Response:** Verify that the correct file is named on the INPUTDD parameter. Verify that the file named on the INPUTDD parameter contains PostScript or PDF data. Then resubmit the command.

---

**ARS4922I ARSPDOCI completed code rc**

**Explanation:** The PDF indexer completed processing the input data with the completion code listed.

**User Response:** No action is required.

---

**ARS4923E action version rc string**

**Explanation:** A message that displays the product version and release.

**User Response:** No action is required.

---

**ARS4924E Error executing action API rc =rcError string: string**

**Explanation:** The Adobe toolkit returned an error.

**User Response:** Verify the directories that are specified on the FONTLIB and TEMPDIR parameters. Verify the directory permissions. Verify that the directories named on the FONTLIB parameter provide access to the fonts that are required by the PDF indexer. Verify that the directory named on the TEMPDIR parameter contains sufficient free

space to process the input file. If the problem persists, contact your IBM Service Representative.

---

**ARS4925I**    **Usage:** arspdump -f filename [-F font\_dir] [-h] [-o output file]  
                 [-p page number] [-t temp dir]  
                 **Version:** *version*  
                 **-f:** PDF file name  
                 **-F:** Font directory  
                 **-h:** This message  
                 **-o:** Output file (default is stdout)  
                 **-p:** Specifies the page number (default is all pages)  
                 **-t:** Temp directory

**Explanation:** An incorrect parameter was specified for the command.

**User Response:** Resubmit the command with the correct parameters. For more information about this command, please Chapter 6, "ARSPDUMP reference" on page 37.

## Chapter 5. ARSPDOCI reference

---

### Purpose

Generate index data for a PDF file.

---

### Syntax

**Note:** The following syntax should be used only when you run the ARSPDOCI program from the command line or call it from a user-defined program.

```
►► ARSPDOCI [COORDINATES=metric] FIELDn=spec [FONTLIB=pathList]
► INDEXn=spec [INDEXDD=fileName] [INDEXSTARTBY=pageNumber]
► INPUTDD=fileName [MSGDD=fileName] OUTPUTDD=fileName PARMDD=fileName
► [TEMPDIR=fileSystem] TRIGGERn=spec
```

---

### Description

The ARSPDOCI program can be used to index a PDF file. The ARSLOAD program automatically calls the ARSPDOCI program if the input data type is PDF and the indexer is PDF. If you need to index a PDF file and you do not want to use the ARSLOAD program to process the file, then you can run the ARSPDOCI program from the command line or call it from a program.

---

### Parameters

Refer to Chapter 3, “Parameter reference” on page 17 for details about the parameters that you can specify when you run the ARSPDOCI program from the command line or a user-defined program.

---

### IFS location

**/usr/bin/arspdoci**  
The executable program.

---

---

## Chapter 6. ARSPDUMP reference

---

### Purpose

Print the locations of text strings on a page.

---

### Syntax

```
▶▶ ARSPDUMP -f inputFile [-F fontFile] [-h] [-o outputFile]
▶ -p sheetNumber [-t tempDir] ▶▶
```

---

### Description

The ARSPDUMP program can be used to identify the locations of text strings on a page in a PDF file. You can use this program to help define triggers and fields. When you define triggers and fields, you must specify the location of the string value used to locate the trigger or field as x and y pairs in a coordinate system imposed on the page. For each string value, you must identify the upper left and lower right position on the page. The output of the ARSPDUMP program contains a list of the text strings on the page and the coordinates for each string. If a font is referenced in a PDF file, but not embedded, then the ARSPDUMP program attempts to find the font using information provided with the -F flag. If the ARSPDUMP program does not find the font, then it uses a substitute Adobe Type 1 font.

---

### Parameters

**-f inputFile**

The file name or full path name of the PDF file to process.

**-F fontDir**

Identifies directories in which fonts are stored. Specify any valid path. Use the colon (:) character to separate path names. The ARSPDUMP program searches the paths in the order in which they are specified. If you do not specify this flag and name a font directory, then the ARSPDUMP program attempts to locate fonts in the /QIBM/ProdData/OnDemand/Adobe/fonts directory.

**-h**

Lists the parameters and their descriptions for the ARSPDUMP program.

**-o outputFile**

The file name or full path name of the file into which the ARSPDUMP program writes output messages. If you do not specify this flag and name a file, then the ARSPDUMP program writes output to the display (interactive) or the joblog (batch).

**-p sheetNumber**

The number of the page in the PDF file that you want the ARSPDUMP program to process. This is the page that contains the text strings that you want to use to define triggers and fields. The sheet number is the order of

the page as it appears in the file, beginning with the number 1 (one), for the first page in the file. Contrast with page identifier, which is user-defined information that identifies each page (for example, iv, 5, and 17-3).

**-t tempDir**

Identifies the directory that the ARSPDUMP program uses for temporary work space. Specify any valid directory name. If you do not specify this flag and name a directory, then the ARSPDUMP program uses the /arstmp directory for temporary work space.

---

## Examples

The following example shows how to invoke the ARSPDUMP program within QSHELL to print the strings and locations of text found on page number three of sample.pdf to sample.out:

```
arspdump -f sample.pdf -o sample.out -p 3
```

See the *IBM Content Manager OnDemand for iSeries Common Server Administration Guide* for more information about running ARSPDUMP using QSHELL.

---

## IFS location

**/usr/bin/arspdump**

The executable program.

---

## Part 3. Generic indexer reference

This part of the book provides information about the OnDemand generic indexer. You can use the generic indexer to specify index data for other types of input files that you want to store in OnDemand.

---

## Chapter 7. Overview

OnDemand provides the generic indexer to allow you to specify indexing information for input data that you cannot or do not want to index with the OS/400 Indexer or the PDF Indexer. For example, suppose that you want to load documents into OnDemand that were created with a word processor. The documents can be stored in OnDemand in the same format in which they were created. The documents can be retrieved from OnDemand and viewed with the word processor. However, because the documents do not contain SCS, AFP, line data, or PDF, you cannot index them with the standard OnDemand indexers. You can specify index information about the documents to the generic indexer and load the documents into OnDemand. Users can then search for and retrieve the documents with the OnDemand client program.

To use the generic indexer, you must specify index data for each input file or document that you want to store in and retrieve from OnDemand. You specify the index data in a parameter file. The parameter file contains the index fields, index values, and information about the input files or documents to process. The generic indexer retrieves the index data from the parameter file and generates the index information that is loaded into the database. OnDemand creates one index record for each input file (or document) that you specify in the parameter file. The index record contains the index values that uniquely identify a file or document in OnDemand.

The generic indexer supports group-level indexes. Group indexes are stored in the database and used to search for documents. You must specify one set of group indexes for each file or document that you want to process with the generic indexer.

You use the ARSLOAD program (along with your generic indexer input files) to load data on the system. The ARSLOAD program will invoke the generic indexer to process the parameter file and generate the index data. The ARSLOAD program will then add the index information to the database and load the input files or documents specified in the parameter file into OnDemand.

---

### Processing AFP data

You can specify a parameter file for input files that contain AFP resources and documents and process them with the generic indexer. However, when you specify the parameter file:

- The starting location (byte offset) of the first AFP document in the input file should always be 0 (zero), even though the actual starting location is not zero when AFP resources are contained in the input. AFP resources are always located at the beginning of an input file. The actual starting location of the first document in the input file is zero plus the number of bytes that comprise the resources. However, to process AFP documents with the generic indexer, you do not need to calculate the number of bytes taken by the resources.
- The starting locations of the other documents in the input file should be calculated using the length of and offset from the previous document in the input file.

The generic indexer will determine where the AFP resources end in the file and process the documents using the offsets and lengths that you provide, relative to where the resources end.

---

## Chapter 8. Specifying the parameter file

The input to the generic indexer program is the input file or files that you want to store in OnDemand and a parameter file that contains the indexing information for the files or documents. To use the generic indexer, you must create a parameter file that contains the indexing information for the files or documents that you want to process. This section describes the parameter file for the generic indexer.

There are three types of statements that you can specify in a parameter file:

- Comments. You can place a comment line anywhere in the parameter file.
- Code page. You can specify one and only one code page line. If you specify a code page line, you must do so at the beginning of the parameter file, before you define any of your groups.
- Groups. A group represents a document that you want to index. Each group contains the application group field names and their index values, the location of the document in the input file, the number of bytes (characters) that make up the document, and the name of the input file that contains the document.

**Note:** The parameter names in the generic index file are case sensitive and must appear in uppercase. For example, `GROUP_FIELD_NAME:account` is valid, while `group_field_name:account` is not.

---

### CODEPAGE:

Specifies the code page of the input data. You can specify one and only one code page. The **CODEPAGE:** line must appear before you specify any of the groups. The **CODEPAGE:** line is required.

#### Syntax

**CODEPAGE:**cpgid

#### Options and values

The character string **CODEPAGE:** identifies the line as specifying the code page of the input data. The string cpgid can be any valid code page, a three to five character identifier of an IBM-registered or user-defined code page.

#### Example

The following illustrates how to specify a code page of 37 for the input data:

```
CODEPAGE:37
```

---

### COMMENT:

Specifies a comment line. You can place comment lines anywhere in the parameter file.

#### Syntax

**COMMENT:** text on a single line

## Options and values

The character string **COMMENT:** identifies the line as containing a comment. Everything after the colon character to the end of the line is ignored.

### Example

The following are examples of comment lines:

```
COMMENT:
COMMENT: this is a comment
```

---

## GROUP\_FIELD\_NAME:

Specifies the name of an application group field. Each group that you specify in the parameter file must contain one **GROUP\_FIELD\_NAME:** line for each application group field. (The application group is where you store a file or document in OnDemand. You specify the name of the application group to the ARSLOAD program.) OnDemand supports up to 32 fields per application group. If the field names that you specify are different than the application group field names, then you must map the field names that you specify to the application group field names on the application Load Information page.

Specify a pair of **GROUP\_FIELD\_NAME:** and **GROUP\_FIELD\_VALUE:** lines for each application group field. For example, if the application group contains two fields, then each group that you specify in the parameter file must contain two pairs of **GROUP\_FIELD\_NAME:** and **GROUP\_FIELD\_VALUE:** lines. The following is an example of a group with two application group fields:

```
GROUP_FIELD_NAME:rdate
GROUP_FIELD_VALUE:05/31/00
GROUP_FIELD_NAME:studentID
GROUP_FIELD_VALUE:0012345678
```

The group lines must appear after the **CODEPAGE:** line.

### Syntax

```
GROUP_FIELD_NAME:applgrpFieldName
```

## Options and values

The character string **GROUP\_FIELD\_NAME:** identifies the line as containing the name of an application group field. The string `applgrpFieldName` specifies the name of an application group field. OnDemand ignores the case of application group field names.

### Example

The following shows some examples of application group field names:

```
GROUP_FIELD_NAME:rdate
GROUP_FIELD_NAME:studentID
GROUP_FIELD_NAME:account#
```

---

## GROUP\_FIELD\_VALUE:

Specifies an index value for an application group field. Each group that you specify in the parameter file must contain one **GROUP\_FIELD\_VALUE:** line for each application group field. (The application group is where you store a file or document in OnDemand. You specify the name of the application group to the ARSLOAD program.) OnDemand supports up to 32 fields per application group.

The **GROUP\_FIELD\_VALUE:** line must follow the **GROUP\_FIELD\_NAME:** line for which you are specifying the index value.

Specify a pair of **GROUP\_FIELD\_NAME:** and **GROUP\_FIELD\_VALUE:** lines for each application group field. For example, if the application group contains two fields, then each group that you specify in the parameter file must contain two pairs of **GROUP\_FIELD\_NAME:** and **GROUP\_FIELD\_VALUE:** lines. The following is an example of a group with two application group fields:

```
GROUP_FIELD_NAME:rdate
GROUP_FIELD_VALUE:05/31/00
GROUP_FIELD_NAME:studentID
GROUP_FIELD_VALUE:0012345678
```

The group lines must appear after the **CODEPAGE:** line.

## Syntax

**GROUP\_FIELD\_VALUE:**value

## Options and values

The character string **GROUP\_FIELD\_VALUE:** identifies the line as containing an index value for an application group field. The string value specifies the actual index value for the field.

## Example

The following shows some examples of index values:

```
GROUP_FIELD_VALUE:05/31/00
GROUP_FIELD_VALUE:0012345678
GROUP_FIELD_VALUE:0000-1111-2222-3333
```

---

## GROUP\_FILENAME:

The file name or full path name of the input file. If you do not specify a path, then the generic indexer searches the current directory for the specified file.

Each group that you specify in the parameter file must contain one **GROUP\_FILENAME:** line. The **GROUP\_FILENAME:** line must follow the **GROUP\_FIELD\_NAME:** and **GROUP\_FIELD\_VALUE:** lines that comprise a group. The following is an example of a group:

```
GROUP_FIELD_NAME:rdate
GROUP_FIELD_VALUE:05/31/00
GROUP_FIELD_NAME:studentID
GROUP_FIELD_VALUE:0012345678
GROUP_OFFSET:0
GROUP_LENGTH:0
GROUP_FILENAME:/tmp/statements.out
```

If the **GROUP\_FILENAME** line is blank (null), then the generic indexer uses the value of the **GROUP\_FILENAME** line from the previous group to process the current group. In the following example, the input data for the second and third groups is retrieved from the input file that is specified for the first group:

```
GROUP_FIELD_NAME:rdate
GROUP_FIELD_VALUE:05/31/00
GROUP_FIELD_NAME:studentID
GROUP_FIELD_VALUE:0012345678
GROUP_OFFSET:0
GROUP_LENGTH:8124
GROUP_FILENAME:/tmp/statements.out
```

```

GROUP_FIELD_NAME:rdate
GROUP_FIELD_VALUE:06/30/00
GROUP_FIELD_NAME:studentID
GROUP_FIELD_VALUE:0012345678
GROUP_OFFSET:8124
GROUP_LENGTH:8124
GROUP_FILENAME:
GROUP_FIELD_NAME:rdate
GROUP_FIELD_VALUE:07/31/00
GROUP_FIELD_NAME:studentID
GROUP_FIELD_VALUE:0012345678
GROUP_OFFSET:16248
GROUP_LENGTH:8124
GROUP_FILENAME:

```

If the first **GROUP\_FILENAME** line in the parameter file is blank, then you must specify the name of the input file when you run the ARSLOAD program.

The group lines must appear after the **CODEPAGE:** line.

## Syntax

**GROUP\_FILENAME:**fileName

## Options and values

The character string **GROUP\_FILENAME:** identifies the line as containing the input file to process. The string fileName specifies the file name or full path name of the input file.

## Example

The following are valid file name lines:

```

GROUP_FILENAME:/tmp/statements
GROUP_FILENAME:D:\ARSTMP\statements
GROUP_FILENAME:statements
GROUP_FILENAME:

```

---

## GROUP\_LENGTH:

Specifies the number of contiguous bytes (characters) that comprise the document to be indexed. Specify 0 (zero) to indicate the entire input file or the remainder of the input file. Each group that you specify in the parameter file must contain one **GROUP\_LENGTH:** line. The **GROUP\_LENGTH:** line must follow the **GROUP\_FIELD\_NAME:** and **GROUP\_FIELD\_VALUE:** lines that comprise a group. For example:

```

GROUP_FIELD_NAME:rdate
GROUP_FIELD_VALUE:05/31/00
GROUP_FIELD_NAME:studentID
GROUP_FIELD_VALUE:0012345678
GROUP_OFFSET:0
GROUP_LENGTH:0

```

The group lines must appear after the **CODEPAGE:** line.

## Syntax

**GROUP\_LENGTH:**value

## Options and values

The character string **GROUP\_LENGTH:** identifies the line as containing the byte count of the data to be indexed. The string value specifies the actual byte count. The default value is 0 (zero), for the entire (or remainder) of the file.

## Example

The following illustrates how to specify length values:

```
GROUP_LENGTH:0
GROUP_LENGTH:8124
```

---

## GROUP\_OFFSET:

Specifies the starting location (byte offset) into the input file of the data to be indexed. Specify 0 (zero) for the first byte (the beginning) of the file. (If you are processing AFP documents and resources with the generic indexer, see “Processing AFP data” on page 41.) Each group that you specify in the parameter file must contain one **GROUP\_OFFSET:** line. The **GROUP\_OFFSET:** line must follow the **GROUP\_FIELD\_NAME:** and **GROUP\_FIELD\_VALUE:** lines that comprise a group. For example:

```
GROUP_FIELD_NAME:rdate
GROUP_FIELD_VALUE:05/31/00
GROUP_FIELD_NAME:studentID
GROUP_FIELD_VALUE:0012345678
GROUP_OFFSET:0
```

The group lines must appear after the **CODEPAGE:** line.

## Syntax

**GROUP\_OFFSET:**value

## Options and values

The character string **GROUP\_OFFSET:** identifies the line as containing the byte offset (location) of the data to be indexed. The string value specifies the actual byte offset. Specify 0 (zero), to indicate the beginning of the file.

## Example

The following illustrates offset values for three documents from the same input file. The documents are 8 KB in length.

```
GROUP_OFFSET:0
GROUP_OFFSET:8124
GROUP_OFFSET:16248
```

---

## Chapter 9. Parameter file examples

The following example shows how to specify indexing information for three groups (documents). Each document will be indexed using two fields. The input data for each document is contained in a different input file.

```
COMMENT:
COMMENT: Generic Indexer Example 1
COMMENT: Different input file for each document
COMMENT:
COMMENT: Specify code page of the index data
CODEPAGE:37
COMMENT: Document #1
COMMENT: Index field #1
GROUP_FIELD_NAME:rdate
GROUP_FIELD_VALUE:07/13/99
COMMENT: Index field #2
GROUP_FIELD_NAME:studentID
GROUP_FIELD_VALUE:0012345678
COMMENT: document data starts at beginning of file
GROUP_OFFSET:0
COMMENT: document data goes to end of file
GROUP_LENGTH:0
GROUP_FILENAME:/arstmp/statement7.out
COMMENT: Document #2
COMMENT: Index field #1
GROUP_FIELD_NAME:rdate
GROUP_FIELD_VALUE:08/13/99
COMMENT: Index field #2
GROUP_FIELD_NAME:studentID
GROUP_FIELD_VALUE:0012345678
GROUP_OFFSET:0
GROUP_LENGTH:0
GROUP_FILENAME:/arstmp/statement8.out
COMMENT: Document #3
COMMENT: Index field #1
GROUP_FIELD_NAME:rdate
GROUP_FIELD_VALUE:09/13/99
COMMENT: Index field #2

## **Part 4. Appendixes**

---

## Appendix. Notices

This information was developed for products and services offered in the U.S.A.

IBM may not offer the products, services, or features discussed in this document in other countries. Consult your local IBM representative for information on the products and services currently available in your area. Any reference to an IBM product, program, or service is not intended to state or imply that only the IBM product, program, or service may be used. Any functionally equivalent product, program, or service that does not infringe on any IBM intellectual property right may be used instead. However, it is the user's responsibility to evaluate and verify the operation of any non-IBM product, program, or service.

IBM may have patents or pending patent applications covering subject matter described in this document. The furnishing of this document does not give you any license to these patents. You can send license inquiries, in writing, to:

IBM Director of Licensing  
IBM Corporation  
North Castle Drive  
Armonk, NY 10504-1785  
U.S.A.

For license inquiries regarding double-byte (DBCS) information, contact the IBM Intellectual Property Department in your country or send inquiries, in writing, to:

IBM World Trade Asia Corporation  
Licensing  
2-31 Roppongi 3-chome, Minato-ku  
Tokyo 106, Japan

**The following paragraph does not apply to the United Kingdom or any other country where such provisions are inconsistent with local law:**

INTERNATIONAL BUSINESS MACHINES CORPORATION PROVIDES THIS PUBLICATION "AS IS" WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESS OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF NON-INFRINGEMENT, MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE.

Some states do not allow disclaimer of express or implied warranties in certain transactions, therefore, this statement may not apply to you.

This information could include technical inaccuracies or typographical errors. Changes are periodically made to the information herein; these changes will be incorporated in new editions of the publication. IBM may make improvements and/or changes in the product(s) and/or the program(s) described in this publication at any time without notice.

Any references in this information to non-IBM Web sites are provided for convenience only and do not in any manner serve as an endorsement of those Web sites. The materials at those Web sites are not part of the materials for this IBM product and use of those Web sites is at your own risk.

IBM may use or distribute any of the information you supply in any way it believes appropriate without incurring any obligation to you.

Licensees of this program who wish to have information about it for the purpose of enabling: (i) the exchange of information between independently created programs and other programs (including this one) and (ii) the mutual use of the information which has been exchanged, should contact:

IBM Corporation  
Software Interoperability Coordinator  
3605 Highway 52 N  
Rochester, MN 55901-7829  
U.S.A.

Such information may be available, subject to appropriate terms and conditions, including in some cases, payment of a fee.

The licensed program described in this information and all licensed material available for it are provided by IBM under terms of the IBM Customer Agreement, IBM International Program License Agreement, or any equivalent agreement between us.

Any performance data contained herein was determined in a controlled environment. Therefore, results obtained in other operating environments may vary significantly. Some measurements may have been made on development-level systems and there is no guarantee that these measurements will be the same on generally available systems. Furthermore, some measurements may have been estimated through extrapolation. Actual results may vary. Users of this document should verify the applicable data for their specific environment.

Information concerning non-IBM products was obtained from the suppliers of those products, their published announcements or other publicly available sources. IBM has not tested those products and cannot confirm the accuracy of performance, compatibility or any other claims related to non-IBM products. Questions on the capabilities of non-IBM products should be addressed to the suppliers of those products.

This information contains examples of data and reports used in daily business operations. To illustrate them as completely as possible, the examples include the names of individuals, companies, brands, and products. All of these names are fictitious and any similarity to the names and addresses used by an actual business enterprise is entirely coincidental.

#### COPYRIGHT LICENSE:

This information contains sample application programs in source language, which illustrates programming techniques on various operating platforms. You may copy, modify, and distribute these sample programs in any form without payment to IBM, for the purposes of developing, using, marketing or distributing application programs conforming to the application programming interface for the operating platform for which the sample programs are written. These examples have not been thoroughly tested under all conditions. IBM, therefore, cannot guarantee or imply reliability, serviceability, or function of these programs. You may copy, modify, and distribute these sample programs in any form without payment to IBM for the purposes of developing, using, marketing, or distributing application programs conforming to IBM's application programming interfaces.
